BORA Ecosystem

Blockchain platform ecosystem

to promote content distribution and user activity

BORA Ecosystem Team

(contact@boraecosystem.com)

March 2018

(Version 1.0)

Abstract

Internet-based content businesses like gaming, entertainment and online social communities have grown on an immense scale. But a lack of transparency and disclosure, the ever-present risk of user asset loss, transaction risk, and the high brokerage costs may reduce user motivation and immersion levels. As such, content providers today are required to increase their efforts to secure loyal users. While some content providers may want to implement blockchain technology, many find the application of new technology and entering into a young market to be a heavy burden. Unfortunately, the current state of developmental support and mitigating risks for blockchain-related projects are still lacking.

The BORA Platform ecosystem is a solution designed to resolve these issues. The BORA Platform design consists of an internal blockchain (BORA Chain) and the Ethereum public blockchain linked together. It provides the high transaction throughput and expandability required for commercial content application services. BORA Chain is designed with a modular architecture, and ensures independent service environments for each application on the platform.

Tokens for internal circulation (BORA Point) within the ecosystem exist within the BORA Chain, and are linked to ERC-20 tokens (BORA Token). Through this structure, user assets are protected, and the transfer process to BORA Token and execution is ensured. As a result, user assets are no longer in a structure that is dependent on existing content providers, but rather exist with the user and ecosystem. Content providers do not need to separately develop new blockchains, and can participate in the decentralized ecosystem using the web interface and API provided by the BORA Platform. The BORA Point Incentive Fund - beneficial to all ecosystem participants - is operated based on smart contracts. Blockchain-based promotion campaigns and rewards programs can be applied to radically improve user retention, ultimately resulting in an increased service Lifetime Value (LTV).

The BORA Ecosystem was designed so that all participants can contribute to the ecosystem and receive reasonable rewards, with voluntary and continuous user activity all driven by the token-based economic system and incentive mechanisms. Behavior that is inappropriate for the ecosystem can be self-regulated as it does not benefit anyone in the ecosystem (including the perpetrator), and content providers within the ecosystem can share the goal and motivation to compete in good faith through service quality improvements rather than unfair practices.

The BORA Platform's first goal is to use trial services for fast network and ecosystem verification, leading to commercialization. Gaming fits this goal best, considering its factors of popularity and intuitiveness. Thus, the developer that entered a partnership with the BORA team is developing a game for the trial service that will be linked with the BORA Chain. The blockchain technology industry is still in its infancy but is continuously advancing and growing. The BORA Platform also has a road map to enhance the platform and

BORA Chain while extending the ecosystem range, matching the advances in technology and ecosystem growth. Through a series of processes, we ultimately want to build and grow an ecosystem that promotes content business circulation and continuous user activity within a decentralized platform environment.

1. Definition of the Problem

1.1. Problems with the Existing Industry

1.1.1. Credibility - Veracity, Transparency, and Security of Information

There have always been credibility issues between the content information sender and receiver in the existing digital industry. This was due to the difficulty in confirming the veracity of the information provided, the lack of transparency in the provision of said information, and the fact that the information could be modified or lost at any time.

Even if the content provider provided valid information, it was difficult for the user to verify the information. It was similarly difficult for the provider to prove and impress on the user the integrity of the information. Take for example, the video game industry. It is difficult for game players to accept at face value that the game randomly shuffles the cards for each new game, and deals the cards fairly for each new hand. Players may still refuse to believe the information provided with the randomized loot box that they have a 1% chance of obtaining a rare game item, and refrain from purchasing the product.

Apart from the questionable accuracy, the transparency in disclosing information is also lacking. Content providers with their own servers and databases could directly control which information is recorded, stored, and shared. As such, it was difficult for users to know which information was recorded, and what level of information was shared. For instance, most mobile games do not provide individual probabilities or expected values for probability-based items sold through in-app purchases as well.[1]

Beyond this, the information in databases could be modified or falsified at any time as a result of a bug, and administrator mistake or by a deliberate action. Sometimes, information can be lost, or even omitted (not recorded). This reversibility of information can cause a negative effect on the service's credibility.

These issues have also caused considerable waste of resources. For instance, in the online poker service[2] we studied: 60% of the customer inquiries were related to 'suspicion of manipulation of game probability and mistrust of game records', and another 25% were that 'game money has been lost or hacked.[3] A

---

[1] South Korea and some jurisdictions require disclosure of information related to these probability-based items, but there is a limit to the disclosure method and level. The App Store also made the disclosure of probabilities for loot boxes (probability-based items) mandatory through its new App Store Review Guidelines on Dec. 21st, 2017. But Apple does not technically verify the disclosed probability, and it is still difficult to judge the veracity of the information actually provided.

[2] An online game service that once recorded $32M in monthly sales, with no manipulation of in-game probabilities

[3] A vast majority of these inquiries stemmed from user misunderstanding. According to the result, the randomization function from game server, that oversees the game logic was running fairly. Most of the game record related complaints and inquiries stemmed from erroneous memories from user experience.

separate customer service group with a large number of personnel had to be opened to handle these complaints and inquiries.

1.1.2. User Asset Value - Dependency, Severity, and Loss

Content providers in the areas such as gaming, online social communities, and entertainment create and/or circulate content with complementing services. Users enjoy and consume the content through a variety of means and often times they involve great deal of time, effort, and money. Through this process, content providers may profit from its popularity and users on the other hand obtain - quite often - emotionally attached, hard-won digital assets. Although, the assets are obtained through value trade-offs, the majority of user assets cannot become the sole property of the user. This is because the digital assets of a user are linked to the content provider's services. The '100M in-game money' accumulated by the user, the 'Platinum status level' built up in the community, and the '100,000-strong army' that was completed with the user's time and money will all disappear once the relevant content services are suspended. They will all disappear, regardless of how much time, effort, or money the user has spent to obtain and accumulate them.[4] This type of user asset dependency reduces the participation, immersion, and payment of the users, who are aware of this limited asset ownership. As such, content providers must put more effort and cost into finding high-loyalty users.

In addition, in cases such as the 'one-to-many' relationship structure between the user and the content service provider, assets accumulated in different services cannot be consolidated, and cannot be value-determined using unified criteria even if they belong to the same user. If an asset's value cannot be determined, then it is not fit for ownership, trade, or transaction. Therefore, the number of users who put their time and resource to acquire these assets can only be a small portion of the whole population of users. For this reason, providers of content such as in the game industry must put in a large cost to increase the user purchase rate - even though it is for a small fraction of increase - via in-app-purchasing or freemium model.

Also, the asset value of content services may be easily harmed or lost. The value of 100 million in-game money, which the user has accumulated through years of play, may plummet to 1/100 of its original value if there are game money duplication hacks or abuses. The game money value will also plummet if the game business suddenly decides to provide 100 million of in-game money every day, for free, to bring in new users. Situations such as these often occur in gaming services.[5]

---

[4] Of course, there are instances of blog service termination where entries are backed up or transferred to another service. However, the user's own entries are most likely only a part of the blog's user accumulated assets.

[5] The Stone of Jordan ring was the valued currency in Diablo 2, but became mass circulated through item duplication. Blizzard applied a special event system patch called Uber Diablo as a means of retrieving the rings. The action of selling the Jordan ring triggered special monsters to appear, which had chance to drop highly-valued items, which made users sell Jordan ring to shop.

Thus, it is difficult to determine and maintain the value of user's digital assets as they are dependent on the content providers, difficult to consolidate and liable to loss by outside force. Obviously, it will also be difficult to engage in trade or transaction activities with the assets of this nature. This effect demotivates and reduce participation from the users, causing a vicious cycle for the content providers due to the increased cost of securing loyal users, which increases the operating cost, resulting in lower service quality, and so forth.

1.1.3. Broker Transactions

Digital assets for some content services have trades or transactions taking place through brokers, with their value acknowledged in the process. In mobile RPG games for example, there may be brokered transactions of game money (e.g. gold, gems), which are purchased from users and then sold to others at a lower price than the in-game shop. In highly trade-activated game services, there are specialized brokers who purchase in-game money from users to resell. They usually purchase chips at around 80% of the in-game shop price, then resell them at around 90% for a 10 - 15% profit. Sometimes the scale of brokered transactions is larger than the sales occurring within the game service itself.

However, transaction fraud and excessive fees during the broker transaction processes increase the transaction risks and expenses, while decreasing transaction quality. Some malicious broker and traders steal in-game money using hacks and also resell the stolen merchandise at low prices. Item trading specialty sites[6] have emerged to resolve these issues, but there are still fraudulent transactions between buyers and sellers which the transaction process is complex, and the transaction fees can be steep.

1.2. Review on Existing Projects

1.2.1. Performance and Expandability

Internet-based commercial content services such as gaming and communities require massive and rapid transaction processing. As such, each project that is preparing for a decentralized application platform is taking its own approach to resolving transaction performance issues. But some blockchain application projects do not show much concern in these areas. One such project, claiming to be a blockchain casino service, does not mention whether it has sufficient capacity to handle hundreds to thousands of blackjack tables operating simultaneously. A game of blackjack lasts 1 minute 30 seconds at most and a new one is created right after where multiple chip transactions occur during the game, and hundreds to tens of

---

[6] Representative sites include opskins.com, itembay.com, and itemmania.com.

thousands of players could simultaneously generate these transactions. As such, a sufficient level of performance to meet such service requirements must be secured.

1.2.2. Burdens of Entering a New Industry

It has been rare to see a complete ground breaking innovation projects to appear in the blockchain landscape. Most projects that appear in the blockchain market currently utilize blockchain technology for incremental improvements, addressing one or two existing shortfalls in the current system. In other words, while there are dozen distinct projects that have come out to disrupt the current money transfer and payment systems and have gained wide recognition and popularity, there aren't as many famed projects in other industries beyond the finance sector. The foremost reason for this is that the industry is still in its early stages, with yet more time required for the completion of projects that are preparing for fully decentralized application ecosystems. But even considering it, there are other issues that should be mentioned.

Content providers attempting blockchain-based application services cannot help but feel greatly at risk. Content providers must sufficiently understand the new technology from the initial phase and develop accordingly, but the development tools and environmental support are still insufficient. Content providers also feel a great deal of concern at the prospect of giving up their existing centralized service method and adopting into a new environment. For these businesses, utilizing blockchain technology may mean abandoning an existing market with hundreds of millions of users for the multi-year challenge of entering a small and newly-formed platform ecosystem. The many projects developing blockchain-based platforms must be able to resolve these issues. If not, it may be a long time until the blockchain-based ecosystem fully matures.

1.2.3. Economic Systems and Monetization

For a single application or ecosystem to have sustainability, it must have beneficial value to all members, including the users. Many projects are planning for decentralized wallets and payment solutions instead of the existing payment modules and credit cards. However, these new solutions alone cannot provide more significant value to the ecosystem participants (e.g. game developers and users) compared to using the Apple App Store or Google Play. If the content provider still needs to pay a platform commission of around 30%, and the user does not perceive any difference other than using a decentralized payment solution underneath it, it will be difficult for blockchain-based platform ecosystems to become widely adopted and used. As such, blockchain projects building application platforms must also consider economic systems that can handle these issues.

Also projects such as blockchain-based game services (not ecosystem applications) must consider economic feasibility and monetization. For example, if a project generates ERC-20 based tokens and provides a game that run on these tokens, players are burdened with high transaction costs.[7] Specifically, if there are frequent transactions within a fixed commission fee structure, the user's expense burden will grow.

For instance, let's suppose there is a Ethereum (ETH) based dice game.

The two players (A and B) with the same participation fee (0.1 ETH) for each player and per round, and they both have the same win ratio, the player who gets the highest number will win both players' participation fee but Ethereum blockchain will require transaction fees (gas 0.01 ETH) to be paid for each round. It would eventually make both players lose 2 ETH after 200 rounds of playing.[8] This simple example does not include the additional service fees that may be imposed by the dice game provider, which (if included) will increase the burden experienced by the user. While this is an extreme and simplified scenario, there is little chance that the user would continue playing this game, and it would be difficult for such a service to grow and sustain its business. Ultimately, the service provider must be concerned about these economic issues and find a way to resolve them. Otherwise, the probability of projects such as '0 Fee Ethereum Dice Game' providing meaningful value to potential users will be low. But there are projects that do not provide clear information on these subjects, and it seems that significant sums of money have been put into these projects with unclear economic feasibilities, as noted above.

1.3. Conclusion

Blockchain takes the existing centralized system and restructures it to a decentralized system. As this new technology begins to spread, gains wider adoption and improvements are made, the issue raised above will be addressed, and the shortfalls of early projects will overcome the adaptation stage.

Our decentralized blockchain base ensures the security and transparency of transaction activities, creating an application platform network in which it is possible to protect user digital assets and generate innovations. This will allow the resolution of existing issues, while providing solutions that vitalize content service circulation and user participation. We call this platform ecosystem 'BORA'.

---

[7] Of course, transaction processing performance issues exist within these types of structures, as was noted previously. That is still the case as of now, although it is expected that the performance and expandability of blockchain technology will continue to grow and evolve.

[8] 2 players playing 200 rounds of dice game will take a maximum of 120 min.

2. Solution 1 - Blockchain Structure

2.1. Summary

We define BORA as 'a blockchain-based platform ecosystem for circulating and stimulating content applications'. Various types of service providers that deal with content, such as gaming, gambling, and communities, can use the BORA Platform to provide their services easily and quickly. The BORA Platform has been designed with a modular architecture that enables independent blockchain execution by the content provider. This ensures undisturbed autonomous execution and prevents noisy-neighbor issue. Users will be given a unified user experience across the various content services of the BORA Ecosystem. Personal identity, account, and assets are will be unified and will be interchangeable within the platform. Assets and their values accumulated through every content service interaction will be compatible and accepted within the platform. And above all, the BORA Platform has the performance and scalability to reliably process the amount of activities required for these content services.
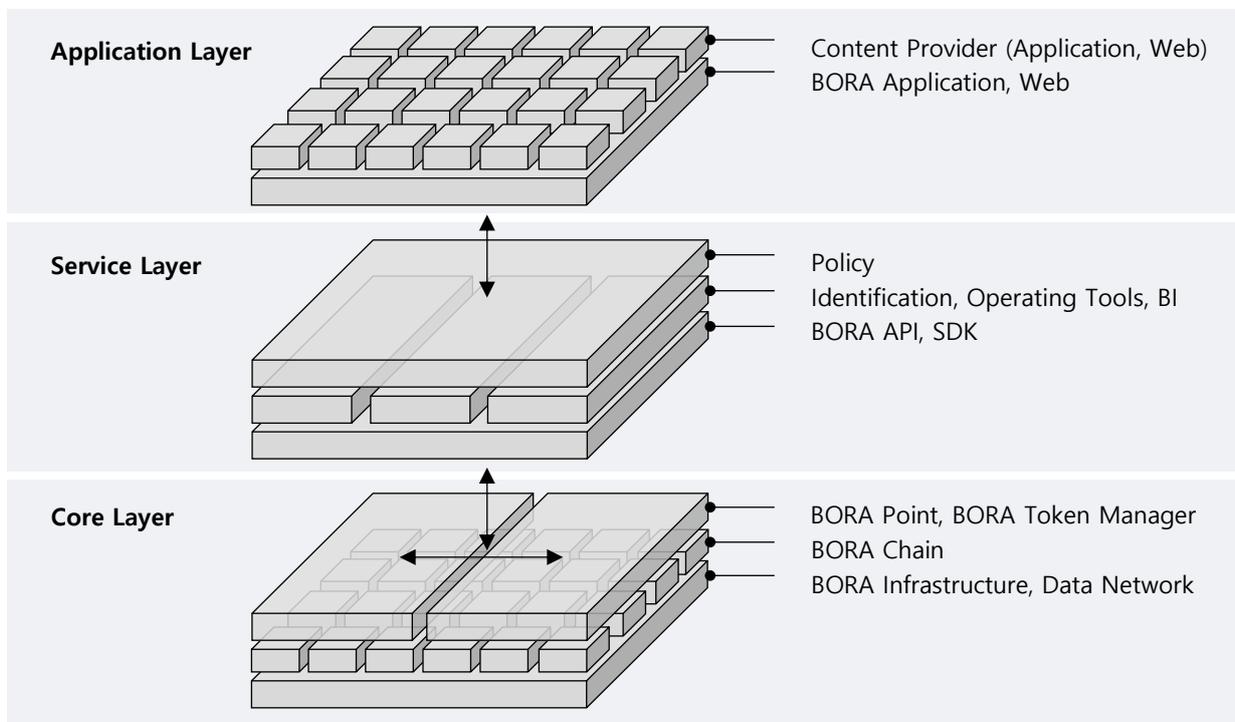

2.2. Platform Layer Architecture

Figure 1. BORA Platform Layer Architecture

2.2.1. Core Layer

In platform businesses such as games and game communities, it is very important to quickly apply/remedy changes and bugs in the system without causing downtime. It is also critical for a platform provider to reliably provide high performance throughput as well as scalability to accommodate large volumes of traffic and their dynamic change. However, public blockchains such as Ethereum currently fall short when it comes to innately accommodating large volume of transactions. This is due to the transaction processing mechanism scalability, and economic feasibility (gas fee) of the Ethereum. Such high volume traffic can create large overhead and can slow down the entire Ethereum network as it was observed in the case of CryptoKitties.[9] Nevertheless, the Ethereum blockchain is highly useful in that it is currently the most widely accepted blockchain protocol and has huge community based allowing space for future integration with Ethereum based dApps and projects.[10]

While we have decided to utilize ERC-20 as the base of our blockchain design, we had to add some innovations of our own to overcome some of the shortfalls of Ethereum (performance, flexibility and scalability). To resolve these issue, we will be introducing the BORA Chain, an independent modular blockchain that will be linked to the Ethereum blockchain. The BORA Chain is designed to ensure speed, scalability, and flexibility while processing mass user traffic and high volume transactions.
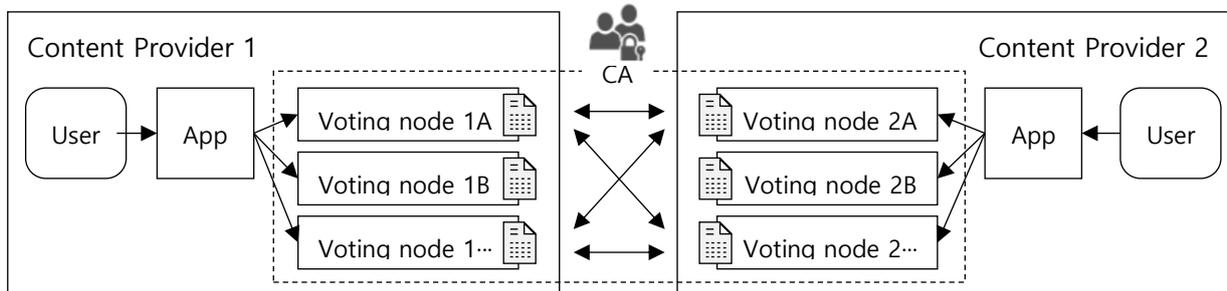

Figure 2. BORA Chain Architecture

As shown above, each content provider in the Bora Ecosystem will be given a private independent blockchain based on permissioned voting algorithm. This design ensures high performance transaction, flexibility, fault-tolerance, and scalability on the content provider's side and prevents noisy-neighbor issue and disruption during transactions.

---

[9] The Ethereum main-chain's transaction processing rate was fully saturated for around 3 days starting Dec. 3rd of 2017. This is assumed to be due to the effects of 'CryptoKitties', which was responsible for 15 - 20% of all Ethereum transactions during the aforementioned dates.

[10] For example, projects such as OmiseGO plan to provide White-label Digital Wallets, allowing the usage of decentralized payment and transaction functions without the need to independently develop a wallet solution dealing in various tokens and assets.

The BORA Chain handles the sub-chain role, responding to each content provider while fulfilling independent functions. Independent sub-chains are assigned and operated by individual content provider (application) units. There are several benefits to this architecture. First, the massive transactions generated by commercial applications in the platform can be handled reliably and rapidly using distributed processing. This also ensures a level of service independence that allows remaining application services within the platform to be unaffected, even if there are critical defects in a specific application or other security/service related issues.

BORA Chain has an internal token system called BORA Point that can only be circulated within the platform. Smart contracts are executed for this internal token. The internal token (BORA Point) belongs to the platform, and may be generated in several different ways depending on the platform growth stage and business needs. For example, tokens can be generated and operated as follows: BORA-Play for game circulation and incentives, BORA-Community for community operation financing and incentives, and BORA-Ticket for event generation and management services. Content application providers do not need to generate separate tokens, and can immediately apply the BORA Point that is appropriate for their individual purposes. Users are provided with a unified asset management environment and user experience. Thus, even if individual services cease or disappear, the existing assets may immediately be utilized in other content provider's services.

Internal tokens (BORA Point) within the BORA Chain are mutually exchangeable with ERC-20 tokens (BORA) in the Ethereum blockchain-based on set rules. And BORA Token holders may easily exchange them for BORA Point at any time to use the platform content services. This architecture is linked and executed by the BORA Token Manager.

Content providers do not need to store all service information on the BORA Chain. They can select which information is necessary and valuable to store in the blockchain, and can use the content provider's own database and logs for the remaining information, as before. For example, in an MMORPG game: the user login/logout record, movement from field A to B, amount of damage dealt to a monster in battle, are information that is unsuitable to store in the blockchain, and the blockchain cannot generate additional value from this. But major results from in-game activity and the user's in-game major asset changes are details that are meaningful to store in the blockchain. A poker player's game results and asset processing information, or a rare game item's system generation, acquisition, ownership and transaction related information are also good examples. This allows the content provider to be free from the development and maintenance burden of having to convert everything into the blockchain, while reducing the expense to the platform ecosystem of managing such massive amounts of data, allowing the user to experience a pleasant and fair service usage environment.

2.2.2. Service Layer

The layer provides development tools (API, SDK) to content providers (applications), who want to join the platform ecosystem. Internal tokens (BORA Point) within the BORA Chain may be linked and used, and user transactions may be recorded in the blockchain.

The layer also provides BORA Chain Explorer, which externally reviews and audits the information recorded in the BORA Chain. This provides external transparency for BORA Chain records, allowing anyone to verify them. The layer also provides service tools for platform ecosystem operation and management, such as user authentication and token transfer. The tools and environment for business operations (such as data analysis and monitoring tools) as well as the policies and rules for platform governance are included.

2.2.3. Application Layer

This layer is where the applications of content providers joining the BORA Ecosystem are located, operating while linked to the BORA Platform. The BORA Platform's own application is provided here, allowing users to view and freely access content applications incorporated into the BORA Ecosystem. Digital asset management and ERC-20 token (BORA) exchange functions are also provided by the BORA App.

To form an ecosystem that grows with its many participants, the BORA Platform has plans to support 3rd party content providers in order to generate additional content. Support is available for the creation of additional value by accessing, using, and processing the various data in the BORA Chain, through the tentatively-named "BORA Data Hub".[11]

3. Solution 2 - Economic System and Incentive Mechanism

3.1. Design Purpose

The contents in solution 1 have been written from a design-centric perspective with the purpose of circulating content applications based on the blockchain platform. In this part, we will deal with the structure of promoting and sustaining content circulation and user activity through the BORA Token mechanism and economic systems.

---

[11] Op.gg that uses the API provided by Riot Games to provide player record statistics service for 'League of Legends', and solutions that analyze data based on publicly available poker hand histories (e.g. Poker Tracker, etc.) are some exemplary case studies.

BORA is an ecosystem that has the form of a multi-sided platform in which both content provider and user participate, and there are stakes involving the investors with BORA Token transactions. Thus, we have designed an economic system and incentive mechanism that benefits all participants, while allowing for free, rational, and sustainable value generating activities.

3.2. Token Mechanism

The BORA Ecosystem has a dualistic structure, with the token 'BORA' following Ethereum's ERC-20 standards, and the internal token 'BORA Point' based on the BORA Chain. BORA Token may be freely traded through exchanges and has market value, whereas BORA Point are tokens for circulation within the platform ecosystem. The internal and external token are almost identical in terms of their technical structure, as they are both cryptocurrencies based on blockchain technology, but are different in that BORA Point are managed independently within the BORA Blockchain and may only be circulated within the platform ecosystem. BORA Tokens are initially generated by the Ethereum mainnet, but BORA Point are only generated through usage transfer requests on already generated BORA Token.
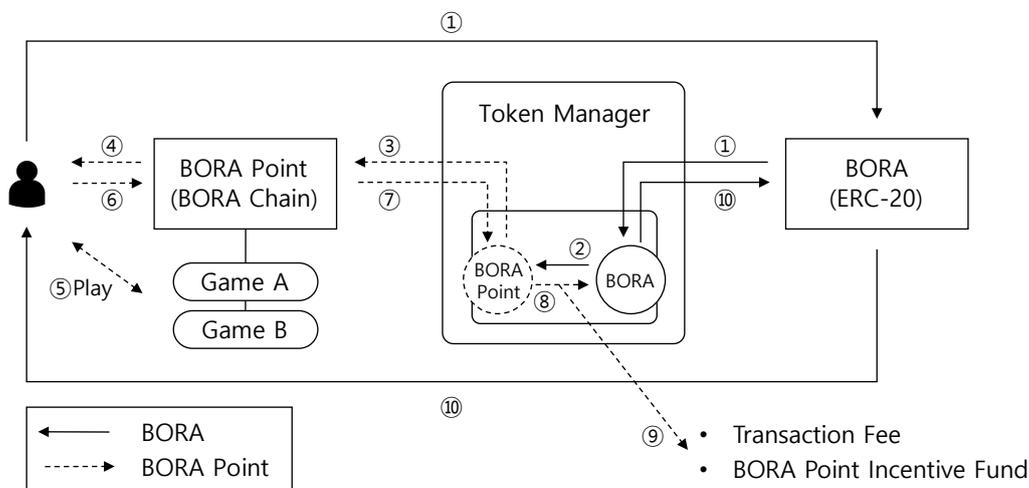

Figure 3. Linkage and Flow of BORA Token and BORA Point

For example, users who wish to play games within the BORA Ecosystem may change their BORA Token to BORA Point. When a transfer request is received, the 'BORA Token Manager' generates BORA Point according to the requested amount, and the requested BORA Tokens are retrieved from the user to be stored. Users can play the game using the issued BORA Point. Users may also transfer held BORA Point to BORA Token at any time. To accomplish this, the BORA Token Manager retrieves the requested BORA Token from the stored balance of BORA Point and provides them to the user. The BORA Point are retrieved and disappear.

To further clarify the phrase 'retrieve and disappear,' BORA Point can be seen as loan coupons that are only circulated within the platform, where the value of BORA Token is provided as collateral. Thus, the user's request to transfer BORA Point back to BORA Token is the retrieval of a loan coupon, and the return of BORA Token takes place according to the value retrieved. Theoretically, the amount of BORA Point that can be generated through smart contracts will be the 'total supply of BORA Token issued in the market multiplied by the exchange rate to BORA Point'. This structure means that the issuance and circulation of BORA Point managed in its blockchain are fully controlled by BORA Token, the ERC-20 token. In other words, not only will it have a technical characteristic guaranteeing execution and record keeping based on blockchain technology, but there cannot be any discretionary engagement by individuals or specific organizations in the issuance and circulation mechanism. As such, these specific encrypted tokens for platform circulation are, strictly speaking, different from existing in-game currencies and content service points that may be additionally issued, removed, or modified policy-wise at the sole discretion of the operating business. This allows for other designs, setting it apart from existing blockchain and cryptocurrency-based economics.

3.3. Incentive for Ecosystem Vitalization and Growth

3.3.1. Design Purpose

As written above, the design goals for the token mechanism and economic system are to generate ecosystem value and sustain growth. This is only possible if reasonable motivations and expected values are provided to basically all platform ecosystem participants (all users, content providers, and platforms). To accomplish this, we operate the 'BORA Point Incentive Fund,' and adhere to the following design principles.

(A) We can call a platform ecosystem successful if it is possible for participants to generate value, and if such activities are sustained.

(B) 'Value' here can be determined by participant scale and participant activity scale.

(C) As the number of participants increases and the activity of participants increases, the volume of BORA Point increases also.

(D) The volume increase of BORA Point means that the BORA Ecosystem will eventually grow.

(E) Thus, we place a high value in the usage and circulatory activities for BORA Play, and will create an incentive system in order to promote and sustain such activities.

(F) The incentive system is not operated at the discretion of the platform, and its execution is guaranteed based on the BORA Chain according to pre-defined rules.

3.3.2. Incentive Fund Purpose and Expected Effect

As users and activity levels increase, the ecosystem's value becomes greater and more BORA Point can circulate. Some portion of the distributed BORA Point will be saved to BORA Point Incentive Fund, to be re-utilized as a resource for platform ecosystem vitalization. Saved assets are distributed among the participants in ecosystem value generation (users, businesses, platform operators) according to the BORA Platform characteristics. Distribution execution and results are carried out according to the blockchain and smart contracts, with consistency, transparency, and credibility. These distributed values are beneficial to everyone.

First, the user will receive incentive rewards based on the rational criteria of ecosystem contribution from one's activities (e.g. game play, content purchase). These rewards may be exchanged at any time for BORA Token. This is an attractive and rational reward to the user, continuously stimulating user activity.

Content providers can utilize incentives for a variety of additional financing. This financing may be used as a business operation asset to increase system reliability, or exchanged for BORA Token. This kind of financial benefit mechanism can be a clear motivating factor for content providers to continue providing or increasing their ecosystem contributions. The service provider also uses the shared platform circulation token (BORA Point), instilling solidarity and a sense of responsibility. It also allows for value generation through normal activities, reducing the motivation for improper behavior within the ecosystem. Ultimately, it leads in a progressive direction toward better content service quality, and allows for the promotion of good faith competition among businesses.

The BORA Platform can also be used to secure financing for ecosystem operations. Thus, it is possible to secure a healthy and sustainable source for ecosystem operations financing, even if dependencies on other profit mechanisms (e.g. market commission, revenue sharing) are lowered. This allows for the removal of the excessive profit structure from the platform design, which can directly or indirectly increase the willingness of external content providers to participate in the BORA Ecosystem.

3.3.3. Incentive Fund Operation Method

The BORA Point Incentive Fund's execution is fundamentally guaranteed by smart contracts in the BORA Chain. It manages: the asset savings, distribution target and rule setting, execution of asset distribution, and the balancing of BORA Point within the Fund that exist as a result of savings and distribution.

Financing for the Incentive Fund can largely be classified into two parts. First, to execute BORA Ecosystem operations, some of the distributed BORA Token assets are changed into BORA Point and saved in the BORA Point Incentive Fund. This amount becomes the seed for the first incentive financing. Second, when BORA Point are exchanged to BORA Token, part of the changed amount is saved in the Incentive Fund.

Incentives can be gifted to everyone who participated and was active in the ecosystem during a set period of time. The aforementioned BORA Point saved in the BORA Point Incentive Fund are used for payment financing. The method of payment target assessment, payment cycle, payment scale, and other issues will be made public when operational stability has been secured through future testing and other activities. These will all be executed through smart contracts. To aid your understanding, here is a simple example: as an incentive, 10% of the BORA Point Incentive Fund's balance can be paid every week to all address accounts that generated BORA Point transactions according to the stake of each individual transaction. Payment can be made to each address directly, or may incorporate some entertainment factors such as weekly lotteries or jackpots. Or, operations can utilize a combination of the two.

3.4. BORA Point's Flexible Extension Architecture

The BORA Platform ecosystem can accommodate various types of content providers such as gaming, gambling, and communities. As each of these have different service architectures, monetization models and user environment characteristics, it may make it inappropriate for BORA Point to be operated as the sole economics system. For example, mobile social casino games can use the application's own in-app purchase to entice players to make purchases, but blog services will find it difficult to charge fees to writers; instead it may be more appropriate to provide a writing-friendly environment and tools for free. These differences make their economic mechanisms different as well. It is the same when providing services like 'CryptoKitties' or issuing / circulating limited edition celebrity digital avatars.

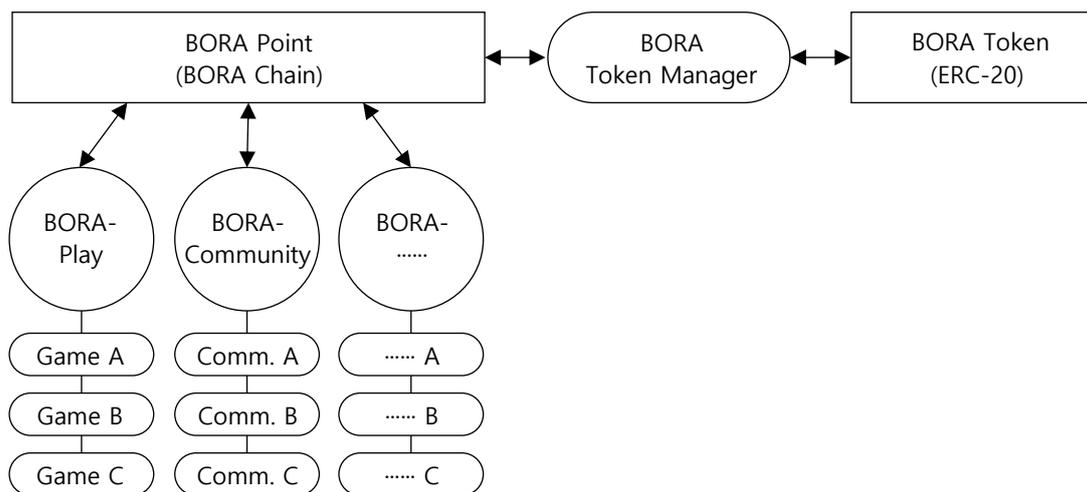

Figure 4. BORA Point's Flexible Extension Architecture

Thus, BORA Point has a flexible and expandable architecture that allows it to cope with diverse service

environments. In other words, BORA Point is the generic term for the token circulated within the platform ecosystem by the BORA Chain, and there may be several different types of BORA Point depending on the platform operation needs. BORA-Play will be launched first, to cope with the needs of regular game play. This can subsequently be expanded to new types of BORA Point (e.g. BORA-Ticket, BORA-Community, etc.) depending on the situation.

3.5. Monetization

The BORA Platform can apply a monetization model for ecosystem maintenance and growth. Various models utilized in existing industries will be referenced, but appropriate methods will be decided on a rational level that fits the architecture and direction of the BORA Ecosystem.

1) Fees for changing BORA Point to BORA Token:
   Within the BORA Ecosystem, BORA Point may be changed to BORA Token at any time, at the discretion of the holder. From the user's perspective, this means a change from activity value to external market value; and from a bio-ecosystem's perspective, this means internal activity energy is exiting the ecosystem. To perform this change, the requester must pay a fixed fee, and the collected fees will be used for platform network operations and supplying the ecosystem's internal energy. Fees will also contribute to preventing the abuse and network spam caused by meaningless transactions.

2) Transaction fees for some large-scale content providers using the BORA Chain:
   BORA Platform is an ecosystem shared by multiple participants. Thus, if a content provider requiring massive transactions (extreme example would be Facebook) participates, the services ecosystem transaction processing share will increase, which could have negative effects on the services of other providers. As such, it will be provided for free at a base level, but fees may be claimed from participants requiring transactions that exceed a certain level. Participants with such transaction fee charges should be limited to a fraction of content services.

4. BORA Platform Ecosystem Usage Cases

The BORA Platform ecosystem will be verified through trial services, and the ecosystem participation scale will be extended with a focus on games. Afterwards, it will expand to a genre-related business ecosystem that includes game communities, game advertisements and marketing agencies. It will also expand to non-

gaming genres with similar business structures. Token economic systems and incentive mechanisms that are internal to the ecosystem will be added to cope with this expansion. The following are some examples of content businesses that can be developed using the BORA Platform ecosystem.

4.1. Games

4.1.1. P2P Play

Competitive games like 'Clash Royale' creates value for play through confrontation and competition between players. But boredom and loss of motivation to play is an issue, as PvP play gets repetitive. To give an example of PvP in the RPG genre, players with good results in a certain mode obtain in-game goods (e.g. gems) through weekly placement rewards or other similar methods. In the long run though, you need to have sufficient statistics increases (e.g. good equipment for higher fighting strength) to obtain good results, and the types or amount of goods rewarded will not be sufficient motivators to a player that already has high stats.

The BORA Platform provides development tools (BORA Toolkit for P2P) that can be applied to P2P play. Games that apply this toolkit can apply BORA Point for entry fees to PvP play modes, win rewards, and rank rewards for their service. Game players will have a certain goal and motivation to play and obtain BORA Point rewards from the platform. Game providers can maintain their game services oriented for high-immersion players, increasing the game's LTV.

4.1.2. Prize Pool Event

BORA Platform's event development tool (BORA Toolkit for Prize) can be used to provide prize pool-type play modes and promotion events in various games. For example, in an action adventure game such as Temple Run, event promotions can be held using BORA Point as a reward to promote user play and entice users to return. A provider offering Texas Hold'em poker can hold a poker tournament event with BORA Point as the reward for players using free game chips. Tournament participation requirements such as requisite levels and entry fee conditions can be set to increase utilization and free chip usage. Game businesses can apply BORA Point events in their free play channels, achieving effects similar to the purchase conversion of non-paying users. This is because free channel players can obtain BORA-Play through events, which creates the motivation for them to transfer to the BORA Point dedicated play channel.

4.1.3. Specialty Items

In some games, there are instances where special types of items, or items that have value due to their extreme rarity, are made available. The BORA Platform provides development tools (BORA Toolkit for Items) for these services. These tools can be utilized for services selling items like 'CryptoKitties', or applied in a mobile baseball game to develop and circulate a legendary baseball team deck as a special item. When linked to the toolkit provided by the BORA Platform, the item's data such as issuance, total circulation numbers, transactions, and item attribute information are recorded and stored in the BORA Chain. Service providers can use the toolkit to provide various types of special items. Users can receive guarantees of the item's ownership and value, and they can trade items at low risk and cost environment. Information such as total number issued and ownership status are transparently revealed, preventing the potential devaluation of items by additional issuance at the service provider's sole discretion.

4.1.4. Item Transaction

Game services (such as MMORPGs) that have transaction systems such as item auction houses which can utilize the development tools (BORA Toolkit for Trade) provided by the BORA Platform to promote item transactions and increase player usage of the game. In a conventional game service architecture, transactions occurred by trading game items and in-game currencies (e.g. gold, gems). As such, players who wanted to make profit through item transactions, had to use external item transaction sites that were based on cash payment. To carry out transactions, users had to go through tedious processes that left them open to fraud and item theft, and had to pay a fee to both the transaction site and the game. But for direct transactions in an in-game transaction system using BORA-Play, BORA Chain and smart contracts provide transaction ease and security to the user while reducing the fee expenses. Also, game service can obtain an amount of BORA Point as a fixed transaction fee, allowing it to generate profit through direct transaction operations, rather than the indirect monetization method, by collecting in-game currencies as the fee.

4.2. User Reward Program

Various reward programs are used by different content businesses to increase customer retention and LTV. Unlike e-commerce, it was difficult for the producers of content such as games, communities, and videos to provide cash-based reward programs, making them mostly dependent on online items, item discount benefits or other limited reward types that could only be circulated internally. Content providers can use the development tools (BORA Toolkit for Rewards) provided by the BORA Platform to operate loyalty programs that can be linked to actual benefits for users. BORA Point can be rewarded to new users achieving a certain level, building their affinity to the service, and VIP level based programs can also be operated.

4.3. Game Community and Related Business

Many game players share game information, discuss strategies, evaluate games, and even make suggestions to the development team by being active in communities. Generated player's information and sharing activities outside of the game do contribute greatly to the game service, but also can generate business value independent of the game itself. Communities where many players gather, are by themselves optimal locations for activities such as sharing game news and advertisements, recruit testers, gamer targeted pre-orders and Focus Group Interview (FGI), as well as marketing surveys. Thus, it may be beneficial to reward the activities of game community information generators and curation contributors through a separate economic system, which is where BORA-Enjoy (tentative name), an internal token within the BORA Chain that differs from the game play related BORA-Play, can come in. Advertisers who wish to advertise games within this community space and marketing agencies who wish to receive pre-orders before a game launch can purchase BORA-Enjoy to support their advertisement and marketing campaigns. This BORA-Enjoy in turn can be used for rewards and incentives to vitalize the community ecosystem. We plan to design dedicated internal tokens with economic systems and provide development tools (BORA Toolkit for Enjoy) to help accommodate this game external community ecosystem within the BORA Platform ecosystem.

4.4. Pre-paid gift card

In countries with low credit card coverage, prepaid gift cards are widely used for digital content. Digital content providers, such as games, sell prepaid cards that include game money and items in cooperation with local mobile phone carriers, or sell game payment products directly in connection with offline stores such as convenience stores. These business types are particularly active in Southeast Asian countries, contributing to the digital content business growth and user expansion in the region. BORA Ecosystem can develop 'BORA Sponsorship Program' and provide 'BORA Gift Card' through partnership with overseas regional mobile phone carriers. In this case, users can use their carrier plan product and at the same time, using BORA Point to enjoy games and services within BORA Ecosystem or other service benefits we provide.

4.5. Extension to Non-Gaming Industries

When game communities and related businesses are incorporated into the BORA Platform ecosystem, expansion to non-gaming areas (e.g. various topic-based communities and related businesses) is possible. Communities, advertisement, marketing surveys and other basic mechanisms are similar to the usage cases within the game industry, so we plan to allow non-game-related businesses to use the above-mentioned token economic systems and development tools when joining the BORA Ecosystem.

5. Conclusion

The BORA Chain will reduce the burden on content providers of privately developing and maintaining a new blockchain and cryptocurrency network. It provides a service environment with high transaction performance and expandability, and ensures the independence of individual content services. Content providers can use the web interface and API to quickly and easily link to the blockchain, and operate the BORA Chain efficiently using the operation tools. They can also use the BORA Token architecture based economic system to create new value.

Users can enjoy a better service environment in which reliable information is transparently disclosed. The user's digital asset (BORA Point) no longer depends on the content provider, and is owned and valued by the BORA Chain and the ecosystem platform. The incentive mechanism within the BORA Ecosystem will promote activity for all ecosystem participants (user, provider, platform), contributing to the growth of the ecosystem. Ultimately, the BORA Ecosystem can resolve some existing issues and provide new opportunities and greater value to all participants.

6. Road Map

The BORA Platform ecosystem will go through several stages including launch and verification, commercialization, ecosystem expansion and evolution. The initial priority is to quickly implement the platform ecosystem, and verify the ecosystem through trial services. Afterwards, we plan to enlarge the platform and expand to accommodate related industries, with necessary development, test, verification, business development and marketing.

6.1. Stage 1 – Prototype

The platform ecosystem's prototype will be completed. With the cooperation with early-partners, 1 to 2 prototype game applications will incorporate in to the ecosystem, and the overall ecosystem mechanism will be verified in testnet. The following details belongs to this stage.

- BORA Ecosystem prototype
  - Develop and evaluate BORA Chain
  - Develop and evaluate BORA Platform development toolkit
  - Develop and evaluate BORA Platform application
- BORA Ecosystem pilot service (testnet)
  - Synchronize, verify functions and launch pilot service of early-partner game application
  - Develop and evaluate operation of BORA Point tool for game business providers
- Expand development team

6.2. Stage 2 – Launch Ecosystem

By completing the evaluation of BORA Ecosystem, the initial version of BORA Chain and BORA Ecosystem application will be released officially to mainnet. Early partner applications will also be officially released through BORA Ecosystem. Meanwhile, through the use of the testnet, development and verification for live operation environment and tool will be conducted, and contents provider's development and evaluation environment improvement will be tested. The following details belongs to this stage.

- BORA Ecosystem official service (mainnet)
  - Release BORA Chain 1.0
  - Release BORA Platform application 1.0
  - Launch commercial game application service

- Improve development and QA environment

- Research UX/UI

- Expand development and business team

- Expand partnerships and marketing

6.3. Stage 3 – Enlarge Ecosystem

Once the commercial service stage is completed, the game service and game users are planned to be expanded along with the ecosystem. Additional development tools corresponding to various game service types will be provided, with operational tools and data providing systems to establish a stable service status. Increase the activities of the business team (business development, alliances, marketing, public relations) to increase participation of both content providers and users. And research new BORA Point currency economies and business models to accommodate the ecosystem entry of game-related content businesses (e.g. game user communities) and the acceptance of third-party services (e.g. advertising agencies, external data analysis services).

- Improve service application develop and QA environment
  - Expand game service development kit (BORA Toolkit)
  - Expand live operation tool, data provision system
- Launch prototype of game-related business (testnet)
  - Research game-related contents business model
  - Develop and evaluate new BORA Point economy
- Accommodate more game services to ecosystem
- Global business development and marketing
- Expand development, business, operation team

6.4. Stage 4 - Ecosystem Expansion

To interact and develop the actively-growing game based ecosystem with other businesses, we accommodate communities and game-related businesses. Also, to provide various business flows and distribution, diverse solutions (e.g. payment and remittance solutions through e-wallets and user authentication solution) will be provided. And in order to expand the ecosystem to non-game-related business area, we will improve the BORA Chain performance, scalability, and proceed to research for new business models and economic system.

- Research and evaluation for performance enhancement of BORA Chain

- Evaluate diverse business support solution (e-wallet, user authentication)

- New business modelling and research to accommodate non-game contents business

- Strengthen global business development and marketing

- Expand development and business team

6.5. Stage 5 – Evolution

Ensure that the BORA Ecosystem prospers and becomes a sustainable development structure. Expand the scale of system to accept more games and game-related businesses, and simultaneously develop new toolkits to accommodate new content-based businesses, and expand global partnerships. And when the decentralized application ecosystem matures, we proceed to transform BORA Chain to public chain protocol and execute a sustainable plan for continuous growth of the ecosystem.

7. Token Sales Plan

7.1. Sales Purpose

We are confident that the issues, mentioned at '1.1. Problems with the Existing Industry', can be resolved and new sustainable value can be created using the BORA Platform ecosystem. The ecosystem will issue the ERC-20 BORA Token to gain the trust and motivation required for operation and growth, and have a structure in which the internal BORA Chain will be linked to the BORA Token. We will sell a portion of the issued BORA Tokens to secure funding for the construction of the decentralized content circulation platform ecosystem.

Funds raised will first be allocated for the BORA Chain network, platform application, development tools for content providers, and platform operation tool development to construct the ecosystem. It may also be used in the budget for business development and the execution of partnership and marketing campaigns, as well as for general expenses (legal, accounting, auditing, administrative) necessary for project execution and team operations.

Token Sale and Allocation guide will be provided on a separate document

7.2. Token Issuance and Distribution Plan

Users who want to support the BORA project and contribute to the construction of the platform ecosystem can send ether (ETH) to the smart contract system that issues BORA Ecosystem tokens (BORA) to receive their BORA Token according to the stipulated exchange rate. During the issuance period, BORA Tokens are generated by smart contracts and distributed. BORA Tokens are distributed to each pool and have the same value and function.

An initial amount of BORA Token will be issued by smart contracts, and there will be no additional BORA Token issued. Issued tokens are allocated into usage purpose pools as follows.

A. Sales (40%)

   40% of the issued BORA Tokens will be sold to investors. Pre-sale or crowd sale methods will be used as sales for investors who want to support the BORA Platform ecosystem and contribute to its development.

B. Company reserve (20%)

   20% of the issued BORA Tokens will be vested for BORA Ecosystem related and required development business expansion, partnership and possible budget for investment. Tokens in this

pool may not be used for reward for specific individuals or organizations, business or investment unrelated to the BORA Platform ecosystem, or expenses for R&D.

C. Ecosystem (25%)

25% of the issued BORA Tokens will be used to create incentive funds in the ecosystem, to issue new BORA Point tokens, to finance operations, and to support early partner development.

D. Development team, advisors (15%)

15% of the issued BORA Tokens will be allocated for the development team and project advisors who contributed to the initial project design and development. BORA Tokens are distributed to the development team and advisors will be vested by the smart contract and are released sequentially in accordance with the elapsed days since the initial token issuing. 25%, 50%, 25% of development team compensation is paid for each 6, 12, and 24 months after the initial issuance of BORA Token.

## 7.3. Utilization Plan for Funds Raised from Sales

Figure 5. Utilization Plan for Funds Raised from Token Sales

A. BORA Platform network and development tools, application development (70%)

The funds raised through BORA Token sales will primarily be used to construct the BORA Chain network and platform ecosystem. First, the funds will be used to develop the BORA Chain network connecting to the EVM (Ethereum Virtual Machine), and to construct the token system and infrastructure. The funds will also be used to develop the developer tools (Toolkit), operation tools, and BORA application for participation in the BORA Ecosystem.

B. Business development, partnership, marketing (14%)

The BORA business team is planning to pursue business collaboration with various game developers

for the construction and early vitalization of the platform ecosystem. The team will also enter into external sponsorship initiatives such as advertisement campaigns, and seek business cooperation with related business partners such as game development platforms. Marketing activity will initially focus on letting people know of the BORA Platform ecosystem, and on raising user awareness to secure initial participants in the ecosystem. A portion of the funds raised will be used in this series of activities.

C. Research, consulting, legal, accounting, auditing (10%), Operating expenses (6%)
    Incorporation for the BORA Platform construction, legal consulting, legal and accounting reviews for the business model will be performed. Funding research and consulting for token sale as well as other legal services will be utilized with regard to the notification of conditions and advance notices for token sales to preliminary investors. Intellectual property related tasks will be carried out for the technology, business model, and trademark. A portion of the funds raised will be used in this series of activities.

8. Disclaimer

IMPORTANT NOTICE: PLEASE READ THE ENTIRETY OF THIS "Disclaimer" SECTION CAREFULLY. WE RECOMMEND YOU CONSULT A LEGAL, FINANCIAL, TAX OR OTHER PROFESSIONAL ADVISOR(S) OR EXPERTS FOR FURTHER GUIDANCE PRIOR TO PARTICIPATING IN THE BORA ECOSYSTEM TOKEN SALE OUTLINED IN THIS WHITE PAPER.

1. Legal Statement

(a) This whitepaper ("Whitepaper"), in its current form, is circulated for general information purposes in relation to the Bora Network blockchain project as presently conceived and is subject to review and revision. The information in this Whitepaper is current only as of the date on the cover hereof. Thereafter, the information in this whitepaper and/or information concerning Boranetwork PET, Ltd. ("Bora Network") may have changed since this date.

(b) No person is bound to enter into any contract or binding legal commitment in relation to the sale and purchase of the BORA Token and no payment is to be accepted on the basis of this Whitepaper. Any sale and purchase of the BORA Token will be governed by a legally binding agreement, the details of which will be made available separately from this Whitepaper. In the event of any inconsistencies between the above mentioned agreement and this Whitepaper, the former shall prevail.

(c) This Whitepaper does not constitute or form part of any opinion on any advice to sell, or any solicitation of any offer by the issuer/distributor/vendor of the BORA Token to purchase any BORA Token nor shall it or any part of it nor the fact of its presentation form the basis of, or be relied upon in connection with, any contract or investment decision.

(d) The BORA Tokens are not intended to constitute securities, units in a business trust, or units in a collective investment scheme, each as defined under the Securities and Futures Act (Cap. 289) ("SFA") of Singapore . Accordingly, this Whitepaper therefore, does not, and is not intended to, constitute a prospectus, profile statement, or offer document of any sort, and should not be construed as an offer of securities of any form, units in a business trust, units in a collective investment scheme or any other form of investment, or a solicitation for any form of investment in any jurisdiction.

(e) No BORA Token should be construed, interpreted, classified or treated as enabling, or according any opportunity to, purchasers to participate in or receive profits, income, or other payments or returns arising from or in connection with the Bora Ecosystem, BORA Tokens, or products, or to receive sums paid out of such profits, income, or other payments or returns.

(f) This Whitepaper and any part hereof may not be reproduced, distributed or otherwise disseminated in any jurisdiction where offering tokens in the manner set out this Whitepaper is regulated or prohibited.

(g) No regulatory authority has reviewed, examined or approved of any of the information set out in this Whitepaper. No such action has been or will be taken under the laws, regulatory requirements or rules of any jurisdiction. The publication, distribution or dissemination of this Whitepaper does not imply that the applicable laws, regulatory requirements or rules have been complied with.

2. Restrictions on Distribution and Dissemination

(a) The distribution or dissemination of this Whitepaper or any part thereof may be prohibited or restricted by the laws or regulatory requirements of any jurisdiction. In the case where any restriction applies, you are to inform yourself about, and to observe, any restrictions which are applicable to your possession of this Whitepaper or such part thereof (as the case may be) at your own expense and without liability to Bora Network or its representatives, agents, and related companies (including Way2bit Co., Ltd. and Borahub Co., Ltd.) ("Affiliates"). (b) Persons to whom a copy of this Whitepaper has been distributed or disseminated, provided access to or who otherwise have the Whitepaper in their possession shall not circulate it to any other persons, reproduce or otherwise distribute this Whitepaper or any information contained herein for any purpose whatsoever nor permit or cause the same to occur.

3. Disclaimer of Liability

(a) The BORA Tokens and related services provided by Bora Network and its Affiliates are provided on an "as is" and "as available" basis. Bora Network and its Affiliates do not grant any warranties or make any representation, express or implied or otherwise, as to the accessibility, quality, suitability, accuracy, adequacy, or completeness of the BORA Tokens or any related services provided by Bora Network and its Affiliates, and expressly disclaims any liability for errors, delays, or omissions in, or for any action taken in reliance on, the BORA Tokens and related services provided by Bora Network and its Affiliates.

(b) Bora Network and its Affiliates do not make or purport to make, and hereby disclaims, any representation, warranty or undertaking in any form whatsoever to any entity or person, including any representation, warranty or undertaking in relation to the truth, accuracy and completeness of any of the information set out in this Whitepaper.

(c) To the maximum extent permitted by the applicable laws and regulations, Bora Network and its Affiliates shall not be liable for any indirect, special, incidental, consequential or other losses of any kind, in tort, contract or otherwise (including but not limited to loss of revenue, income or profits, and loss of use or data), arising out of or in connection with any acceptance of or reliance on this Whitepaper or any part thereof by you.

4. Representations and Warranties by You

By accessing and/or accepting possession of any information in this Whitepaper or such part thereof (as the case may be), you represent and warrant to Bora Network and its Affiliates as follows:

(a) you agree and acknowledge that:

(i) the BORA Token do not constitute securities or debentures in any form in any jurisdiction;

(ii) this Whitepaper does not constitute a prospectus or offer document of any sort and is not intended to constitute an offer of securities of any form, units in a business trust, units in a collective investment scheme or any other form of investment, or a solicitation for any form of investment in any jurisdiction, and you are not bound to enter into any contract in relation to the sale and purchase of the BORA Token and no payment is to be accepted on the basis of this Whitepaper;

(iii) no BORA Token shall be construed, interpreted, classified or treated as enabling, or according any opportunity to, purchasers to participate in or receive profits, income, or other payments or returns arising from or in connection with the Bora Network, BORA Tokens, Bora Ecosystem or products, or to receive sums paid out of such profits, income, or other payments or returns;

(iv) no regulatory authority has examined or approved the information set out in this Whitepaper, no action has been or will be taken under the laws or regulatory requirements of any jurisdiction and the publication, distribution or dissemination of this Whitepaper to you does not imply that the applicable laws or regulatory requirements have been complied with;

(v) where you wish to purchase any BORA Token, the BORA Tokens are not to be construed, interpreted, classified or treated as: (a) any kind of currency other than cryptocurrency;

(b) debentures, stocks or shares issued by any entity; (c) rights, options or derivatives in respect of such debentures, stocks or shares; (d) rights under a contract for differences or under any other contract with the purpose or pretended purpose to secure a profit or avoid a loss; or (e) units or derivatives in a collective investment scheme or business trust, or any other type of securities;

(b) the distribution or dissemination of this Whitepaper, any part thereof or any copy thereof, or acceptance of the same by you, is not prohibited or restricted by the applicable laws and regulations in your jurisdiction, and where any restrictions in relation to possession are applicable, you have observed and complied with all such restrictions at your own expense and without liability to Bora Network and its Affiliates;

(c) you have a basic degree of understanding of the operation, functionality, usage, storage, transmission mechanisms and other material characteristics of cryptocurrencies, blockchain based software systems, cryptocurrency wallets or other related token storage mechanisms, blockchain technology and smart contract technology; and

(d) all of the above representations and warranties are true, complete, accurate and non-misleading from

the time of your access to and/or acceptance of possession this Whitepaper or such part thereof (as the case may be).

5. Cautionary Note on Forward-Looking Statements

(a) Certain information set forth in this Whitepaper includes forward-looking information regarding the future of the project, future events and projections. These statements are not statements of historical fact and may be identified by but not limited to words and phrases such as "will", "estimate", "believe", "expect", "project", "anticipate", or words of similar meaning. Such forward-looking statements are also included in other publicly available materials such as presentations, interviews, videos etc. information contained in this Whitepaper constitutes forward-looking statements including but not limited to future results, performance, or achievements of Bora Network or its Affiliates.

(b) The forward-looking statements involve a variety of risks and uncertainties. These statements are not guarantees of future performance and no undue reliance should be placed on them. Should any of these risks or uncertainties materialize, the actual performance and progress of Bora Network or its Affiliates might differ from expectations set by the forward-looking statements. Bora Network or its Affiliates undertake no obligation to update forward-looking statements should there be any change in circumstances. By acting upon forward-looking information received from this Whitepaper, Bora Network or its Affiliates' website and other materials produced by Bora Network or its Affiliates, you personally bear full responsibility in the event where the forward-looking statements do not materialize.

6. Potential Risks

(a) Please carefully read every piece of information, understand and analyze the risks related factors before deciding to participate and purchase the BORA Token. The risks include, but are not limited to:

(i) risk of losing access to BORA Token due to loss of private key, credentials and other identification information, or any other kind of custodial or purchaser errors;

(ii) fluctuations of the price of BORA Token post issuance due to the general global market and economic conditions;

(iii) any malfunction, unplanned function or unexpected operation of the Ethereum protocol which may, in turn, cause the BORA Token or the Bora Ecosystem to malfunction or operate in a way that is not expected as they are based on the Ethereum protocol. Ether, the native Ethereum Protocol account unit, may itself lose value in a similar way to BORA Token, and also in other ways;

(iv) changes in political, social, economic and stock or cryptocurrency market conditions, and the regulatory environment in the countries in which Bora Network or its Affiliates conduct their businesses and operations, and the ability of Bora Network or its Affiliates to survive or compete under such conditions;

(v) changes in the future capital needs of Bora Network or its Affiliates and the availability of financing and capital to fund such needs;

(vi) for a number of reasons including, but not limited to, an unfavorable fluctuation in BORA Token value, the failure of business relationships or competing intellectual property claims, the Bora Network project may no longer be a viable activity and may be dissolved or simply not launched;

(vii) the lack of interest from companies, individuals and other organizations for the Bora Ecosystem and services and that may limit public interest in the creation and development of distributed applications. Such a lack of interest could impact the development of and the uses or potential value of BORA Token;

(viii) competition from alternative platforms that may have been established, which could potentially adversely impact the BORA Token and the Bora Ecosystem;

(ix) interfere with the use of BORA Token and the infrastructure of the Bora Ecosystem due to any weaknesses or malware that may be introduced into the software of the Bora Ecosystem. The blockchain used for the platform is also vulnerable to attacks which pose a risk to the platform and the performance of related services;

(x) occurrences of catastrophic events, natural disasters that affect the businesses or operations of Bora Network or its Affiliates and other factors beyond the control of Bora Network or its Affiliates; and

(xi) the BORA Token and other cryptocurrencies are a new, untested technology. In addition to the risks stipulated above, there are other risks that Bora Network and its Affiliates cannot predict. Risks may also occur as unanticipated combinations or as changes in the risks stipulated herein.

(b) If any of such risks and uncertainties develops into actual events, the business, financial condition, results of operations and prospects of Bora Network or its Affiliates could be materially and adversely affected. In such cases, you may lose all or part of the value of the BORA Token.

7. No Further Information or Update

No person has been or is authorized to give any information or representation not contained in this Whitepaper in connection with the BORA Token, Bora Network or its Affiliates and their respective businesses and operations, and, if given, such information or representation must not be relied upon as having been authorized by or on behalf of Bora Network or its Affiliates.

8. No Advice

No information in this Whitepaper should be considered to be business, legal, financial or tax advice regarding the BORA Token, Bora Network or its Affiliates. You should consult your own legal, financial, tax or other professional advisor(s) regarding the BORA Token, Bora Network or its Affiliates and their respective businesses and operations. You should be aware that you may be required to bear the financial risk of any

purchase of BORA Token for an indefinite period of time.
